One can prove that given a regular language L , the DFA with the fewest states recognizing L is unique (up to renaming of states).

On the next slides, we will see how to compute such a smallest DFA.

The algorithm we use assumes that all states are reachable, so to arrive at the correct result in all cases, we start by removing unreachable states.

Computing Reachable States for DFA

```
let reachable_states := {q0};  
let new_states := {q0};  
do {  
    temp := the empty set;  
    for each q in new_states do  
        for each c in  $\Sigma$  do  
            temp := temp  $\cup$  {p such that p =  $\delta(q, c)$ };  
        end;  
    end;  
    new_states := temp \ reachable_states;  
    reachable_states := reachable_states  $\cup$  new_states;  
} while (new_states  $\neq$  the empty set);  
unreachable_states :=  $Q$  \ reachable_states;
```

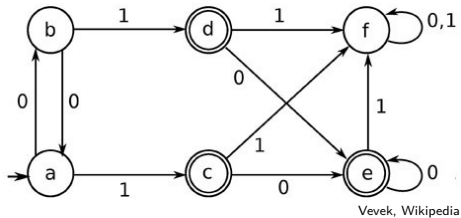

Next, we run the DFA Minimization Algorithm on the next slide with one modification:

It has been proven that it is sufficient to add only one of the sets F or $Q \setminus F$ to W . That is what we will do in the example following the presentation of the algorithm, including the smallest of those two sets (for efficiency).

DFA Minimization Algorithm

```
P := {F, Q \ F};
W := {F, Q \ F};
while (W is not empty) do
    choose and remove a set A from W
    for each c in  $\Sigma$  do
        let X be the set of states for which a transition on c leads to a state in A
        for each set Y in P for which  $X \cap Y$  is nonempty and  $Y \setminus X$  is nonempty do
            replace Y in P by the two sets  $X \cap Y$  and  $Y \setminus X$ 
            if Y is in W
                replace Y in W by the same two sets
            else
                if  $|X \cap Y| \leq |Y \setminus X|$ 
                    add  $X \cap Y$  to W
                else
                    add  $Y \setminus X$  to W
        end;
    end;
end;
```

Example DFA

Example

P: $\{\{c, d, e\}, \{a, b, f\}\}$

W: $\{\{c, d, e\}\}$

Example

P: $\{\{c, d, e\}, \{a, b, f\}\}$

W: $\{\{\cancel{c}, \cancel{d}, \cancel{e}\}\}$

1. iteration: $A = \{c, d, e\}$

Example

P: $\{\{c, d, e\}, \{a, b, f\}\}$

W: $\{\{\cancel{c}, \cancel{d}, \cancel{e}\}\}$

1. iteration: $A = \{c, d, e\}$

$c = 0$:

Example

P: $\{\{c, d, e\}, \{a, b, f\}\}$

W: $\{\{\cancel{c}, \cancel{d}, \cancel{e}\}\}$

1. iteration: $A = \{c, d, e\}$

 $c = 0$: $X = \{c, d, e\}$

Example

P: $\{\{c, d, e\}, \{a, b, f\}\}$

W: $\{\{\cancel{c}, \cancel{d}, \cancel{e}\}\}$

1. iteration: $A = \{c, d, e\}$

$c = 0$: $X = \{c, d, e\}$

$c = 1$:

Example

P: $\{\{c, d, e\}, \{a, b, f\}\}$

W: $\{\{\cancel{c}, \cancel{d}, \cancel{e}\}\}$

1. iteration: $A = \{c, d, e\}$

$c = 0$: $X = \{c, d, e\}$

$c = 1$: $X = \{a, b\}$

Example

P: $\{\{c, d, e\}, \{a, b, f\}, \{a, b\}, \{f\}\}$

W: $\{\{c, d, e\}\}$

1. iteration: $A = \{c, d, e\}$

$c = 0$: $X = \{c, d, e\}$

$c = 1$: $X = \{a, b\}$

Example

P: $\{\{c, d, e\}, \{a, b, f\}, \{a, b\}, \{f\}\}$

W: $\{\{c, d, e\}, \{f\}\}$

1. iteration: $A = \{c, d, e\}$

$c = 0$: $X = \{c, d, e\}$

$c = 1$: $X = \{a, b\}$

Example

P: $\{\{c, d, e\}, \{a, b, f\}, \{a, b\}, \{f\}\}$

W: $\{\{c, d, e\}, \{f\}\}$

1. iteration: $A = \{c, d, e\}$

$c = 0$: $X = \{c, d, e\}$

$c = 1$: $X = \{a, b\}$

2. iteration: $A = \{f\}$

Example

P: $\{\{c, d, e\}, \{a, b, f\}, \{a, b\}, \{f\}\}$

W: $\{\{c, d, e\}, \{f\}\}$

1. iteration: $A = \{c, d, e\}$

$c = 0$: $X = \{c, d, e\}$

$c = 1$: $X = \{a, b\}$

2. iteration: $A = \{f\}$

$c = 0$:

Example

P: $\{\{c, d, e\}, \{a, b, f\}, \{a, b\}, \{f\}\}$

W: $\{\{c, d, e\}, \{f\}\}$

1. iteration: $A = \{c, d, e\}$

$c = 0$: $X = \{c, d, e\}$

$c = 1$: $X = \{a, b\}$

2. iteration: $A = \{f\}$

$c = 0$: $X = \{f\}$

Example

P: $\{\{c, d, e\}, \{a, b, f\}, \{a, b\}, \{f\}\}$

W: $\{\{c, d, e\}, \{f\}\}$

1. iteration: $A = \{c, d, e\}$

$c = 0$: $X = \{c, d, e\}$

$c = 1$: $X = \{a, b\}$

2. iteration: $A = \{f\}$

$c = 0$: $X = \{f\}$

$c = 1$:

Example

P: $\{\{c, d, e\}, \{a, b, f\}, \{a, b\}, \{f\}\}$

W: $\{\{c, d, e\}, \{f\}\}$

1. iteration: $A = \{c, d, e\}$

$c = 0$: $X = \{c, d, e\}$

$c = 1$: $X = \{a, b\}$

2. iteration: $A = \{f\}$

$c = 0$: $X = \{f\}$

$c = 1$: $X = \{c, d, e, f\}$

Example

P: $\{\{c, d, e\}, \{a, b, f\}, \{a, b\}, \{f\}\}$

W: $\{\{c, d, e\}, \{f\}\}$

1. iteration: $A = \{c, d, e\}$

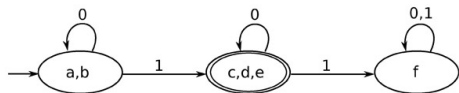

$c = 0$: $X = \{c, d, e\}$

$c = 1$: $X = \{a, b\}$

2. iteration: $A = \{f\}$

$c = 0$: $X = \{f\}$

$c = 1$: $X = \{c, d, e, f\}$

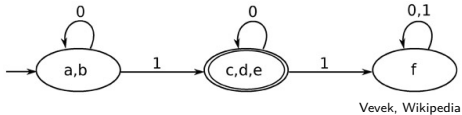

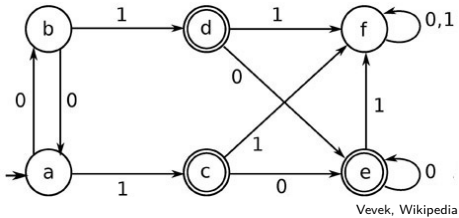

Vevek, Wikipedia

Constructing the Minimal DFA

- The set P is the set of states.
- The start state is the state containing the original start state.
- Any state containing an original final state is a final state.
- If original states a and b are contained in new states S_a and S_b and there is a transition on $\alpha \in \Sigma$ from a to b , then there is a transition on α from S_a to S_b .

Example (continued)

An Application in Type Checking

See the lecture notes for a discussion of how this can be used to decide structural equivalence very efficiently.
